

B.S.A. "SUPERSPORT" FIVE .22" SPORTING RIFLE

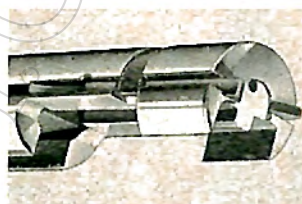

Maker's description :—

A light sporting rifle designed to give functional efficiency over a long period. The latest methods of manufacture have been used to present a rifle of clean lines and attractive appearance.

The body is a robust action enabling a large diameter bolt to be used. The bolt which cocks on opening has twin extractors (*see illustration*) held in position by a single circlip and, with the recess on the bolt face these extractors support and present each round directly in line with the chamber. The cams used to cock the action on opening the bolt are completely enclosed preventing dirt and grit from interfering with the smooth operation of these vital surfaces.

The barrel is 21" bored and rifled to preserve an accuracy of which B.S.A. are justly proud.

Twin Extractors and Recessed Bolt Face

The rifle can be supplied either with open ratchet type rearsight or the more accurate tangent rearsight with integral windage and elevation adjustment.

The foresight blade is located in a slot on the foresight ramp and retained in position by a small screw. The trigger mechanism and five-shot magazine are completely enclosed in a pressure die cast housing which is carried to the full depth of the woodwork and incorporates the trigger guard. The trigger weight is easily adjustable through the large screw in the bottom plate. The trigger can also be altered from double to single pull by tightening up the Allen screw in the rear of the trigger.

Tangent Sight

The Walnut stock is fitted with a cheek piece to give greater comfort and additional facial support ensuring more accurate shooting.

The side safety catch is located for easy application or release by the thumb, and this position, together with the design of bolt handle, enables a telescope sight to be mounted as low as required.

The five-shot magazine with dual guide can be loaded with short, long or long rifle cartridges, and by virtue of the cartridge support, present these three lengths of cartridge with equal efficiency.

General specification :—

Overall weight : 6 lbs.

Overall length : 40 $\frac{1}{2}$ "

Barrel length : 21"

The action bodies of these rifles are machined to enable Parker-Hale "Roll-Off" telescope sight mounts to fit directly on to the rifle without recourse to the attachment of base blocks.
